4.6. Detail project report: 5

4.7. Project demo video: 5

1. Problem Statement:

The goal of the library management system is to create a computerized system to manage all of the library's everyday tasks. This project has numerous capabilities that are typically absent from traditional library management systems, such as the ability for teachers to log in and the ability for users to login. Additionally, it offers an admin login feature that allows the administrator to keep an eye on the entire system. Additionally, it features an online notice

board where instructors, students, and librarians can post information on workshops and seminars taking place in our colleges or nearby colleges after receiving proper authorization from the organization hosting the seminar. It also contains a feature that allows students to see a list of the books they've been provided, along with the date they were issued and returned, and to ask the librarian to add additional books by filling out a form.

2. Features:

- Registration
- Login
- Add Books
- Update Book details
- Search books
- Order books
- View Orders
- Fine Calculations
- Issuing Book
- Returning Book
- Logout

3. Project Evaluation metrics:

3.1. Code:

- You are supposed to write code in a modular fashion
- Safe: It can be used without causing harm.
- Testable: It can be tested at the code level.
- Maintainable: It can be maintained, even as your codebase grows.
- Portable: It works similarly in every environment (operating system).
- You have to maintain your code on GitHub.
- You must keep your GitHub repo public so anyone can check your code.
- Proper readme file you have to maintain for any project development.
- You should include the basic workflow and execution of the entire project in the readme file on GitHub.
- Follow the coding standards.

3.2. Database:

MongoDB is a source-available cross-platform document-oriented database program. Classified as a NoSQL database program, MongoDB uses JSON-like documents with optional schemas.

3.3. API Details or User Interface:

You have to expose your complete solution as an API or try to create a user interface for your model testing. Anything will be fine for us.

3.4. Deployment:

Deploy the application on your preferred service.

3.5. Solutions Design:

You have to submit complete solution design strategies in High-level Document (HLD), Lowlevel Document (LLD), and Wireframe documents.

3.6. System Architecture:

You have to submit a system architecture design in your wireframe document and architecture document.

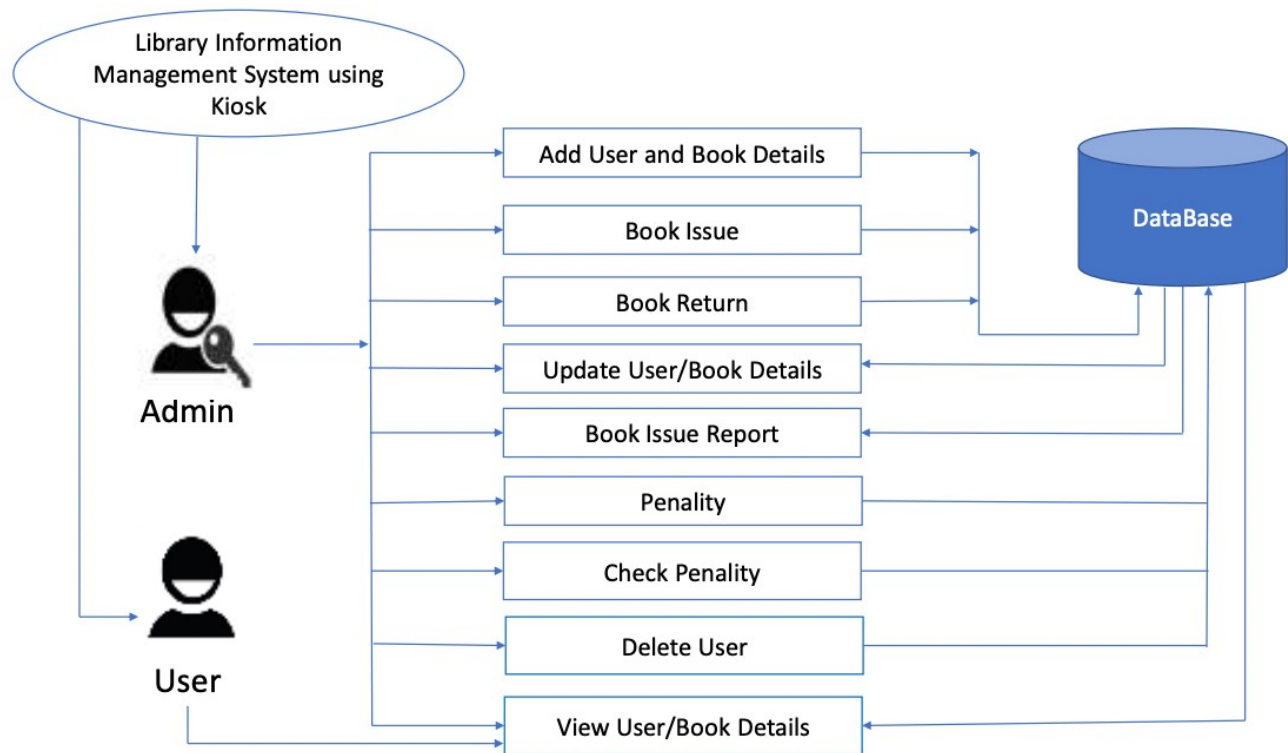

3.7. Optimization of solutions:

Try to optimize your solution on the code level, and architecture level, and mention all of these things in your final submission.

4. Submission requirements:

4.1. High-level Document:

You have to create a high-level document design for your project. You can reference the HLD form below the link.

Sample link: [HLD Document Link](#)

4.2. Low-level document:

You have to create a Low-level document design for your project; you can refer to the LLD from the link below.

Sample link: [LLD Document Link](#)

4.3. Architecture:

You have to create an Architecture document design for your project; you can refer to the Architecture from the link below.

Sample link: [Architecture sample link](#)

4.4. Wireframe:

You have to create a Wireframe document design for your project; refer to the Wireframe from the link below.

Demo link: [Wireframe Document Link](#)

4.5. Project code:

You have to submit your code to the GitHub repo in your dashboard when the final submission of your project.

Demo link: [Project code sample link](#)

4.6. Detail project report:

You have to create a detailed project report and submit that document as per the given sample.

Demo link: [DPR sample link](#)

4.7. Project demo video:

You have to record a project demo video for at least 5 Minutes and submit that link.
